-!- FUNCTION: Decomposes hydrogen peroxide into water and oxygen;
serves to protect cells from the toxic effects of hydrogen peroxide.
                                                                                                                                                                                              BY SIMILARITY.

Parra F., Blanco G., Alonso J.M., Balbin M., Mendez C., Salas J.A.;

"Cloning and sequence of a gene encoding the L7/L12 ribosomal protein equivalent of Streptomyces antibioticus.";

Gene 118:127-129(1992).

-! FUNCTION: SEEMS TO BE THE BINDING SITE FOR SEVERAL OF THE PACTORS INVOLVED IN PROTEIN SYTHESIS AND APPEARS TO BE ESSENTIAL FOR ACCURATE TRANSLATION (BY SIMILARITY).

-! SIMILARITY: BELONGS TO THE L12P FAMILY OF RIBOSOWAL PROTEINS.

ONSET OF METAMORPHOSIS FROM LARVA TO PUPA. THIS GROWTH-BLOCKING PEPTIDE HAS REPRESSIVE ACTIVITY AGAINST JUVENILE HORMONE ESTERASE.
SIMILARITY: BELONGS TO THE GBP / PSP1 / PARALYTIC PEPTIDE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Aizawa T., Fujitani N., Hayakawa Y., Ohnishi A., Ohkubo T., Kumaki Y.,

    -!- CATALYTIC ACTIVITY: ATP + L-citrulline + L-aspartate = AMP + diphosphate + L-argininosuccinate.
    -!- PATHMAY: Arginine blosynthesis; seventh step.
    -!- SUBUNT: Homotectramer (By similarity).
    -!- SUBUNT: Belongs to the argininosuccinate synthase family.

                                                                                                                                                                                                                             ö

-!- PATHWAY: Arginine biosynthesis; seventh step.
-!- SUBUNIT: Homotetramer (By similarity).
-!- SIMILARITY: Belongs to the argininosuccinate synthase family.

**Cloning of rat and meuse syndecan-3 cDNAs.";

submitted (MAR-1996) to the EMBL/GenBank/DDBJ databases.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- PTM: O-GLYCOSYLATED WITHIN THE THRYSER-RICH REGION WHICH COULD INTERACT WITH LECTIN DOMAINS ON OTHER MOLECULES (PROBBALE).

-!- SIMILARITY: BELONGS TO THE SYNDECAN FAMILY OF INTEGRAL MEMBRANE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (POTENTIAL)

-!- FUNCTION: CATALYZES THE DOUBLE CYCLIZATION REACTION WHICH CONVERTS LYCOPENE TO BETA-CAROTENE AND NEUROSPORENE TO BETA-ZEACAROTENE.
-!- PATHWAY: Carotenoid biosynthesis.
-!- SUBCELLULAR LOCATION: Chloroplast, chromoplast.
-!- SUBCELLULAR LOCATION: Of THE LYCOPENE CYCLASE FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Garvey C.F., Malcolm C.A.;
"Anopheles stephensi Dox-A2 shares common ancestry with genes from distant groups of eukarryctes encoding a 265 proteasome subunit and is in a conserved gene cluster."

J. Mol. Evol. 50:497-509(2000).

-!- FUNCIVED IN THE ATP-DEPENDENT DEGRADATION OF UBIQUITINATED PROTEINS (BY SIMILARITY).

-SUBUNIT: THE 265 PROTEASOME IS COMPOSED OF A CORE PROTEASE, KNOWN AS THE 205 PROTEASOME, CAPPED AT ONE OR BOTH ENDS BY THE 195 REGULATORY COMPLEX (RC). THE RC IS COMPOSED OF A LEAST 18

DIFFERENT SUBUNITS IN TWO SUBCOMPLEXES, THE BASE AND THE LID,
WHICH FORM THE PORTITIONS PROXIMAL AND DISTAL TO THE 205 PROTECLYTIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CORE, RESPECTIVELY (BY SIMILARITY).

-!- DOMAIN: CONTAINS 1 PCI DOMAIN.

-!- SIMILARITY: BELONGS TO THE PROTEASOME SUBUNIT S3 FAMILY.

-!- CAUTION: WAS ORIGINALLY (REF.1) THOUGHT TO BE THE DIPHENOL OXIDASE

A2 COMPONENT INVOLVED IN CATECHOLAMINE METABOLISM, MELANIN
FORMATION, AND SCLEROTIZATION OF THE CUTICLE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

"P-domains as shuffled cysteine-rich modules in integumentary mucin [P-domains as shuffled cysteine-rich modules in integumentary mucin [C.1] (FIM-C.1) from Xenopus laevis. Polydispersity and genetic polymorphism.";

J. Biol. Chem. 267:24620-24624(1992).

-!-FUNCTION: Could be involved in defense against microbial infections. Protects the epithelia from external environment.

-!- ALTERNATIVE PRODUCTS:

Event=Alternative splicing; Named isoforms=7;

Comment=Additional isoforms seem to exist. Experimental confirmation may be lacking for some isoforms;

The GDCSP gene encoding P-protein of the glycine cleavage system in the GDCSP gene encoding Plaveria anomala.";
The GDCSP gene Register PGR99-004.

(In) Plant Gene Register PGR99-004.

(In) Plant Gene Register possible to glycine cleavage system catalyzes the degradation of glycine. The P protein binds the alpha-amino group of glycine through its pyridoxal phosphate cofactor, CO(2) is released and the remaining methylamine moiety is then transferred to the lipoamide cofactor of the H protein.

(In) Inpommide cofactor of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DISEASE: Defects in SPINKS are the cause of Netherton syndrome (NS) [MINI-256300], a severe autosomal recessive disorder. It is characterized by congenital ichthyosis with defective confication, a specific hair shaft defect known as trichorrexis invaginate or "bamboo hair", atopic dermatitis, and hayfever. High post-natal mortality is due to failure to thrive, infections and hypernatraemic dehydration.

01-AUG-1992 (Rel. 24, Last sequence update)
Genome polyprotein [Contains: Capsid protein C (Core protein); Matrix protein (Envelope glycoprotein M); Major envelope protein); Matrix protein (Envelope glycoprotein M); Major envelope protein); Monstructural proteins NS1, NS2, NS4A and NS4B; Protease/helicase (EC 2.7.7.48)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Virology 176:643-647(1990)

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       {RNA}(N).
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
OCTAPEPTIDE A-G-Y-G-S-T-L-T, FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERIODICITY IS SUPERIMPOSED.
MISCELLARBOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICE NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE. SIMILARITY: BELONGS TO THE BACTERIAL ICE NUCLEATION PROTEIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;

Cell. Biol. 22:2011-2024(2002).

-!- FUNCTION: Involved in mRNA splicing where it associates with cdc5 and the other cwf proteins as part of the spliceosome.
                                                                                                                                                                           Gaps
